

SILIFORCE HORSES

Recommended for mares, foals, layups, and horses in training. Silicon acts as a regulator for calcium and phosphorous uptake and will directly contribute to a healthy bone cortex and a well-calcified bone matrix. Silicon is also required for formation of healthy connective tissue and collagen (bones, cartilages, ligaments, tendons, hair, skin and hooves). Selenium is essential for the immune system and also acts as a strong anti-oxidant. Boron plays an important role in the transport of calcium to the bones and has synergetic effects in combination with silicon. Boron also has an important role in hormone production and regulation. Scientific research has proven that adding these minerals to a daily diet improves the natural resistance of horses that horses will suffer less diseases, bone-related injuries and connective tissue injuries. **First effects visible after 4 / 6 weeks of utilisation. Safe for racing and competition horses.**

Packaging

250 ml for 75 to 100 days supplies
(Also available 'SILIFORCE PETS', adjusted quantities)

Guaranteed analysis

Selenium	34 ppm
Zinc	38 ppm
Silicon	4600 ppm
Boron	144 ppm

Ingredients

Demi water, PEG 400, Potassium Silicate, Zinc Chloride, Boric Acid and Selenium.
All ingredients are of the highest quality.

More info

Silicon dioxide [SiO₂], which is the quartz crystal found in sand, is not biologically available to mammals. Plants, however, can use Silicon to provide rigidity and structure to some of their cell walls; Horses can obtain minimal amounts in their normal diet of forage and grain. Unfortunately, processing of commercial horse feeds further reduces Silicon's availability from plant sources. However, if Silicon can become hydrated, monosilicic acid [Si(OH)₄] is formed and it provides a highly available form of Silicon that is not available with Silicon from natural sources. **Siliforce Horses** is a new liquid Silicon product derived from monosilicic acid and is a 100% bio-available food supplement. At a daily basis no more than 0.5 ml per 100 kg of body weight is sufficient to achieve therapeutic doses!

Until recently, Sodium Zeolite A was the only biologically available supplemental source of silicon for horses. Sodium Zeolite A is a fluffy powder and must be fed In very large amounts to achieve therapeutic doses. Often it is pelleted or mixed with other ingredients to make it more manageable to feed.
